Data Collection Concept:

Problem: A child born to a teen mother is more likely to die before the age of one.

Data to be collected: Obtaining figures from different hospitals and Health Centers from different parts of Uganda.

Also, getting data from referenced statistics.

A CHILD BORN TO A TEEN MOTHER IS MORE LIKELY TO DIE BEFORE THE AGE OF ONE IN UGANDA(TRUE)

Obstructed labor as experienced by teenage girls which results in increasing risks of infant deaths and research shows that young mothers and their babies are at greater risk of contracting HIV which leads to their deaths before the age of one if not attended to. World Health Organization (WHO fact sheet of updated January 2018) indicated that babies born to adolescent mothers face higher risks of low birth weight, preterm delivery, and severe neonatal conditions than those born to women aged 20 years and above.

Obstructed labor refers to a condition when the uterus is contracting normally but the baby does not exit the pelvis during child birth due to being blocked.

Preterm delivery (premature birth) is births that occur before the 37th week of pregnancy.

If the obstruction is unrelieved, the baby usually dies. According to the 2011 UDHS 2048 babies die as a result of obstructed labor.
